Supporting Information

ABSTRACT: Several different diagnostic tests have been reported for rapid, sensitive, and economical detection of bacterial pathogens, but most lack widespread and practical use in the clinic. In this study, we used anthocyanins from red cabbage (*Brassica oleracea*) as a natural pH indicator and, for the first time, incorporated this agent into a simple, rapid, and economical colorimetric strategy for the detection of *Helicobacter pylori* (*H. pylori*) (RCE@test). We prepared two sets of RCE@test solutions (test 1 is purple, and test 2 is blue) in different forms, including liquid, adsorbed filter paper, and agar, and investigated the performance of each RCE@test as a function of the test volume, *H. pylori* concentration, and reaction time. To elucidate the effect of the pathophysiological environment on these RCE@tests, *H. pylori* in an artificial gastric fluid was also detected. The 10 and 1 CFU/mL *H. pylori* suspensions were detected in 15 min and 3 h, respectively, and the limit of detection was determined down to 1 CFU/mL. We experimentally demonstrated the advantages of the RCE@test for detection of *H. pylori* by comparing it to a commercially available rapid urease test, the “CLO test (*Campylobacter*-like organism test)”. In addition to colorimetric detection by the naked eyes, RGB (Red Green Blue) and Delta-E analysis in image-processing software was run to quantitatively monitor changes in the RCE@test using a smartphone application. Finally, we propose that this test provides simple, effective, rapid, and inexpensive detection and that it can be easily implemented for clinical use.

METHODS

The word 'METHODS' is rendered in a blue, serif font. Each letter is decorated with a hand illustration: 'M' has a hand holding a yellow pencil; 'E' has a hand pointing to a yellow dot; 'T' has a hand holding a yellow flag; 'H' has a hand holding a yellow horizontal bar; 'O' has a hand holding a yellow vertical bar; 'D' has a hand holding a yellow vertical bar; 'S' has a hand pointing to a yellow dot. The hands are in various colors (brown, tan, light brown).

Methods

Red Cabbage Extract Preparation

Red cabbage leaves were cut into small pieces.

100 grams of the material was placed in a 500 mL beaker containing 100 mL of distilled water.

The mixture was exposed to the extraction process by boiling for 30 min.

Methods

Bacterial Strains and Culture Conditions

The *H. pylori* strain was grown at 37 °C under microaerophilic conditions (jar with a gas-generating kit) in tryptic soy agar and Columbia agar base containing 5% sterile sheep blood for about 3 days. The *H. pylori* strain was suspended in 3 mL of saline at different turbidities.
