- Methods
- Results
- Conclusion

Introduction

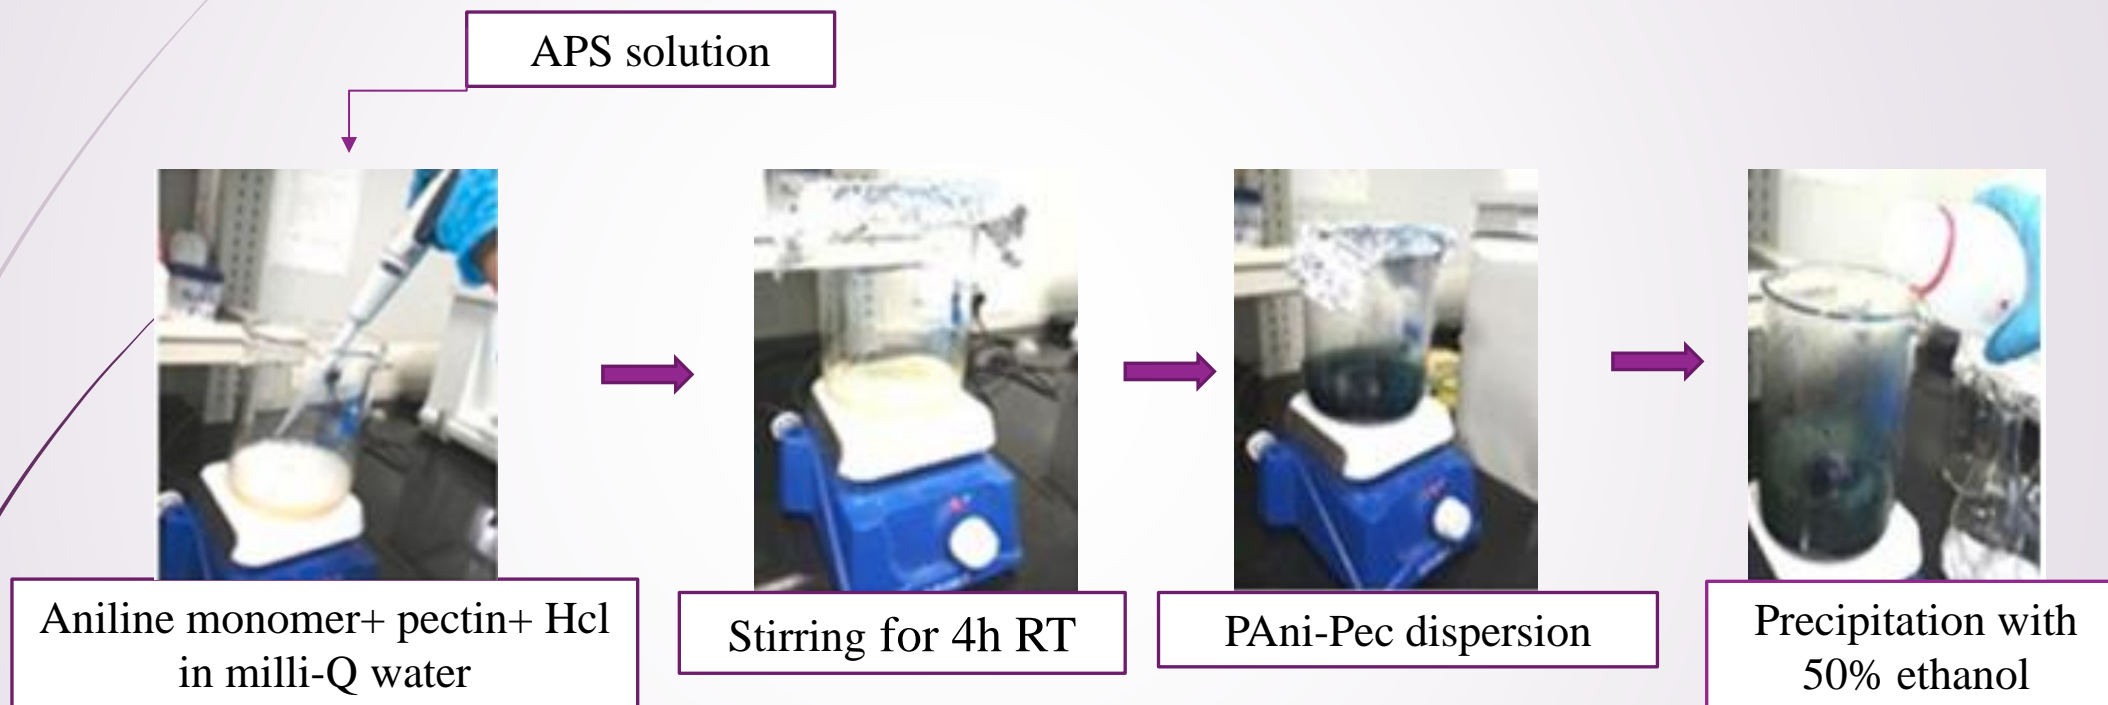

- Milk and milk products play an important role in human diet.
- *E.coli* is One of the frequently microorganisms in milk and milk products.
- Rapid detection of *E. coli* is a major challenge faced by food processing industries.
- Traditionally used conventional methods for the detection of *E. coli* culture-based.

Colorimetric sensor using Polyaniline-Pectin nanoparticles

- Detection approaches using paper-based colorimetric sensors: simplicity, selectivity, rapidity and cost effectiveness
- The development of a simple and cost-effective paper based colorimetric sensor using Polyaniline-Pectin nanoparticles (PANI- PEC NPs).

Methods

Synthesis of PAni- Pec nanoparticles

Synthesis of PANi- Pec nanoparticles

filtration

Washing with 1:1 mixture of ethanol-water

Pure PANi-pec precipitate

Lyophilization

Synthesis of PAni- Pec nanoparticles

Lyophilisation at $-84\pm 1^\circ\text{C}$,
 1 ± 0.5 torr, 4h

Lyophilized Pani-pec
dispersion

1-5mg/ml solution of Pani-pec
in Milli-Q water

Ultra sonication for 4h

ES form of PANI-PEC
solution

EB form of PANI-PEC
solution

Form EB & ES polyaniline

Polyaniline (Emeraldine Base)

Polyaniline (Emeraldine Salt)

Characterization of PANI- PEC nanoparticles

- FTIR spectrum : range 4000–400 cm^{-1}
- UV–Vis spectrum : range 300–1000 nm
- Zetasizer nano

Construction of colorimetric sensor strips

1. Fabrication of PAni-pec solution(1-5mg/ml)
2. Drying at 45°C/30 min in incubator
3. Cutting into strips
4. Exposure to UV in 20 min for surface sterilization
5. PAni-pec strips

Optimization of media components

- Environmental components with different concentrations(0.1-5%) were optimized for *E. coli* selection:
lactose, tryptophan, yeast extract, chondroitin sulphate, sodium lauryl sulphate, potassium chloride, tergitol-7, gentamycin sulphate and ampicillin trihydrate.
- Preparation Cell suspensions of different cell levels ($\sim 8 - \sim 0.5 \log \text{CFU/ mL}$) of *E. coli* in normal saline and inoculated into media prepared.
- ✓ Detection of *E.coli* with maximum growth in minimum time .

Optimization of sample volume

- Prepare $\sim 0.5 \log \text{CFU/mL}$ *E. coli* in normal saline .
- Inoculation of different volumes of normal saline into the optimal medium.
- Rapid color change \rightarrow Optimal sample volume
- Volume optimized: 500 μL

Detection of *E. coli* using PANI- PEC colorimetric sensor

- Preparation of *E.coli* suspension with different concentrations of 8 log CFU/mL to ~0.5 log CFU/mL .
- Evaluated change coloration within 30 min to 12 h.
- Perform protocols for raw milk, pasteurized milk .

Protocol for detection of *E. coli* using paper strip sensor

0.5 ml optimized media

Addition of 0.5 ml of sample

Vortex

Immersion of PAni-Pec strip

Incubation at 37°C

Color change from blue to green indicates the presence of *E. coli*

Mechanism of detection *E. coli*

Selectivity study of PANI- PEC colorimetric strip-based sensor

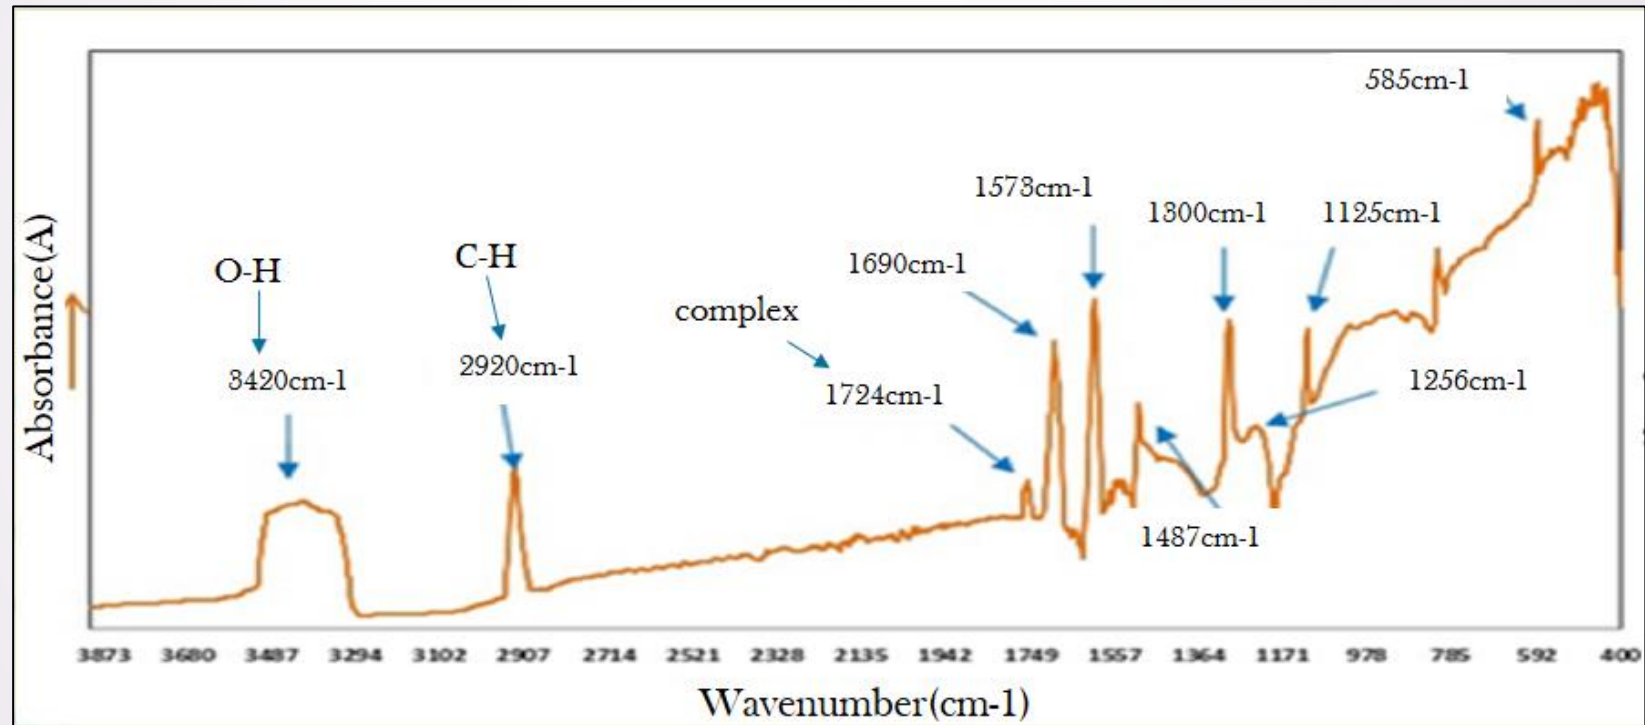

- Determination of sensor selectivity with gram-positive and gram-negative bacteria :
 - *Listeria monocytogenes* / *Staphylococcus aureus* / *Bacillus cereus* / *Enterococcus faecalis*
 - *Salmonella arizonae* / *Enterobacter aerogenes* / *Shigella flexnerii*
- Citrobacter freundii* / *Yersinia enterocolitica* / *Proteus vulgaris*
- Klebsiella pneumoniae* / *Serratia marcescens*

Shelf-life study of PANI- PEC colorimetric strip

- Store the strips at room temperature, 4 °C and- 20° C.
- Check the sensitivity and intensity of the color for 6 months at intervals of 15 days.

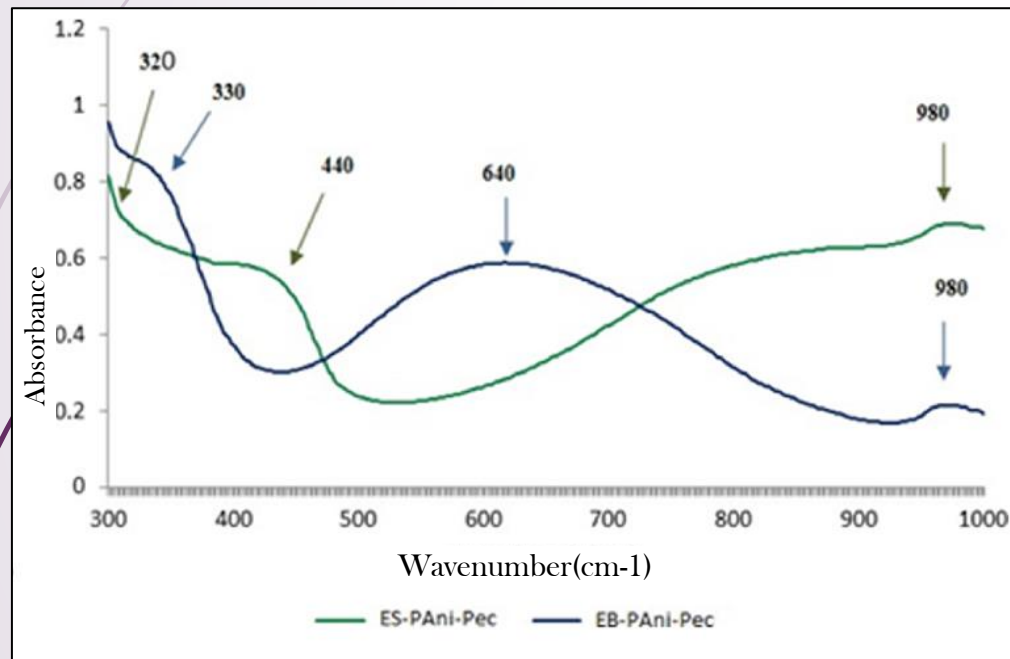

Results

characterization of PANI- PEC nanoparticles

FTIR spectroscopy of PANI- PEC nanoparticles

characterization of PANI-PEC nanoparticles

Shelf-life study of PANI- PEC colorimetric strip

Month	Log CFU/mL	Room temperature		4°C		-20°C		Freshly made strips		Detection time
		Log 8	Control	Log 8	Control	Log 8	control	Log 8	control	
2	8.34									1h 30 min
4	8.74									1h 15min
6	8.52									1h 21 min

Sensitivity of PANI-PEC colorimetric strips stored at different temperatures

Conclusion

- The developed PANI- PEC colorimetric strip-based sensor assay is simple, sensitive and selective. For this reason, it has good sensitivity and selectivity for identifying *E. coli* without interfering with factors like physico-chemical properties of milk.
- Absence of any bio-recognition elements such as antibody, DNA or any enzymes in the strips along with the excellent thermal and environmental stability of polyaniline dramatically improves its shelf life.

Optimization of media components & sample volume

➤ Optimization medium composition:

lactose (0.9%), tryptophan (0.1%), yeast extract (0.45%), chondroitin sulphate (0.015%), sodium lauryl sulphate (0.1%), potassium chloride (2%), tergitol-7 (0.0125%), gentamycin sulphate (0.00016%) and ampicillin trihydrate (0.015%).

➤ The sample volume for the assay was optimized to 500 μL .

Selectivity study of PANI- PEC colorimetric strip-based sensor

Gram negative contaminants	Log CFU/mL
<i>Salmonella arizonae</i>	5.4 ± 0.12
<i>Enterobacter aerogenes</i>	5.2 ± 0.12
<i>Shigella flexneri</i>	7.4 ± 0.12
<i>Citrobacter freundii</i>	6.3 ± 0.76
<i>Yersinia enterocolitica</i>	6.5 ± 0.15
<i>Proteus vulgaris</i>	7.6 ± 0.11
<i>Serratia marcescens</i>	5.7 ± 0.07

Inhibition level of Gram negative contaminants in the developed assay
